

Technical Interview Round 1 – Guidelines for SDE Role

Each candidate will be given a **problem statement** where they will build a small RESTful API application.

This task is designed to test your backend API development skills — your ability to design scalable, clean, and logically sound APIs for real-world scenarios.

✓ Round Overview

- **Round Type:** Virtual – via Google Meet
- **Duration:** 1.5 hours
- **Task Type:** Backend API Development
- **Platform:** Candidate's own machine
- **Environment:** Candidates must be able to share their screen and keep their webcam on throughout the round.

✓ Task Round Details:

1. The Task Round will be conducted virtually and is scheduled to last approximately **1.5 hours**
2. Candidates will receive a Google Meet link in advance and are **required to join on time**.
3. **Technical Requirements:**
 - A **stable internet connection** is mandatory to avoid disruptions.
 - **Webcam and microphone** must be functional, as video and audio interaction must be part of the process.
 - Access to a **quiet and distraction-free environment** is recommended for the duration of the task.

Candidates are expected to:

- Be prepared to share their **screen** if required.
- Ensure all necessary **software, tools, or code editors** are installed and set up beforehand.
- Treat the session as a **formal evaluation**, professional behaviour and clear communication are expected throughout.
- Candidates are allowed to prepare and use a **boilerplate** (project structure and initial setup) prior to the technical round. This setup may include routing, folder structure, basic configuration files, **database connections** etc.
- However, no business logic or implementation related to the problem statement should be included.
- Use any backend stack of your choice (Node, Python, Ruby on Rails, Go, Java, etc.)
- Candidates must prepare and push the boilerplate project to a **public GitHub repository** before **Round-1** begins.
- The initial commit should only contain the boilerplate setup and should be clearly labeled (e.g., `Initial Boilerplate Commit`). Sharing the GitHub link is mandatory prior to the start of Round-1.
- We will provide some test cases (e.g. a payload, API endpoint and expected response), candidate should be able to run them locally via **postman**.
